Stripe

Dear Hiring Team,

I am writing to apply for the Software Engineer, New Grad, Developer & End User Experience Platform position at Stripe in Toronto. I am a Master of Science in Computer Science graduate from the University of Calgary with experience building backend services, APIs, data-intensive systems, and research software. Stripe's emphasis on developer tools, high-quality APIs, product craft, and end-to-end ownership is especially compelling to me because it matches the kind of engineering I enjoy: building systems that are reliable, understandable, and useful to the people who depend on them.

My backend experience includes developing Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I built authentication features, implemented payment-service integration logic, and contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. That work gave me practical experience with service design, database-backed application logic, debugging, and building features that connect user-facing needs with backend implementation details.

In my graduate research, I built C++ and Python systems for scalable Earth observation data processing and retrieval. I developed encoding pipelines, automated geospatial preprocessing workflows, and improved processing performance through multithreading. The project required me to learn unfamiliar systems quickly, make careful design tradeoffs, test assumptions with data, and communicate technical decisions through a peer-reviewed publication and thesis work.

I also bring collaborative engineering and mentoring experience. As a teaching assistant in deep learning, big data, data-at-scale, and database courses, I helped students debug projects, reason about pipelines, understand SQL and cloud workflows, and communicate technical decisions. I am comfortable asking good questions, giving clear feedback, and working with people who bring different levels of context to a problem.

While my strongest production experience is in Python, C++, JavaScript, Django, REST APIs, and PostgreSQL, I understand that Stripe works mostly in Java, Ruby, JavaScript, Scala, and Go. I would bring strong fundamentals, curiosity, and the discipline to learn the team's systems and languages carefully. I am particularly excited by DEeP's work across dashboards, identity and access management, APIs, developer tools, and AI experiences because it combines user empathy with deep platform engineering.

Thank you for considering my application. I would welcome the opportunity to discuss how my software engineering, data systems, and collaborative research experience can contribute to Stripe's Developer & End User Experience Platform team.

Sincerely,

Amir Mirzai Golpayegani
