

September 18, 2026

Dear Hiring Team,

I am writing to apply for the Software Engineer position with your remote stealth startup. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python backend systems, PostgreSQL-backed APIs, data pipelines, AI workflows, and research software, I am excited by the opportunity to contribute to a product where engineering quality directly supports clinical users and real operational needs.

What stands out to me about this role is the combination of backend engineering, AI/ML-adjacent product work, cloud deployment, and close feedback from physicians and customers. I like working on systems where the code is not isolated from the people using it: requirements change, edge cases matter, reliability matters, and strong communication is part of good engineering. That kind of early product environment is motivating to me.

As a back-end developer at Asr Gooyesh Pardaz, I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I built authentication workflows, implemented payment-service logic, stored service-plan and payment records in relational database tables, and contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. This experience maps well to the role's need for backend ownership, product delivery, debugging, and practical API/database work.

My graduate research added a deeper software and data-systems layer to that foundation. I built C++ and Python pipelines for processing, encoding, storing, and retrieving large Earth observation datasets; automated satellite imagery preprocessing; and improved one encoding workflow from 233 seconds to 26 seconds through multithreaded implementation. I also built PyTorch-based model training and evaluation workflows. These projects strengthened my ability to write reliable code, reason about data quality, test assumptions, and improve performance under real constraints.

I also bring AI workflow and automation experience through an agentic job-search platform I am building with LLM workflows, Docker-based services, Google Sheets, Google Drive, Telegram API, and workflow automation tools. In teaching assistant roles, I supported students with AWS-based data pipelines, cloud storage, debugging, SQL, and scalable data workflows. I would be ready to ramp up further on Vue.js, C#/.NET, Go, production Kubernetes/EKS, EHR workflows, and HIPAA-specific practices, while contributing immediately from my Python, PostgreSQL, backend, AWS, AI, and debugging strengths.

Thank you for considering my application. I would welcome the opportunity to bring my backend engineering, AI workflow, data-systems, and research software background to your team.

Sincerely,
Amir Mirzai Golpayegani
