

August 6, 2026

Dear Hiring Team,

I am writing to apply for the Software Engineer, Recording Platform position at Fellow. With a Master of Science in Computer Science from the University of Calgary and experience building Python backend services, large-scale data-processing systems, and AI-assisted automation workflows, I am excited by the opportunity to help Fellow make meeting recordings reliable inputs for the AI Chief of Staff experience.

My backend experience includes developing Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL, implementing authentication and payment-service logic, and contributing to a WebRTC-based chatbot system. That work gave me practical experience with user-facing systems, API integration, speech-related products, debugging across application layers, and keeping backend behavior aligned with real customer workflows.

In my graduate research role, I built Python and C++ software for processing, storing, and retrieving large Earth observation datasets. I automated data ingestion and preprocessing, designed structured tensor-generation pipelines, improved processing performance with C++ multithreading, and documented system behavior and performance tradeoffs for collaborator review. Although the data domain was geospatial rather than meeting media, the engineering pattern is highly relevant: build reliable pipelines, reason carefully about edge cases, measure performance, and turn complex raw data into usable downstream artifacts.

I am also very interested in Fellow's AI-native engineering culture. In my recent agentic job search automation project, I have been building LLM-based workflows with tool orchestration, Google Sheets and Drive integrations, Docker, n8n, OpenClaw, SearXNG, and Telegram API automation. This has made me comfortable using AI tools as part of the software-development process while still applying careful judgment, validation, and documentation.

Fellow's recording platform role appeals to me because it combines backend engineering, reliability, real-world failure investigation, product collaboration, and fast learning in unfamiliar systems. I do not claim deep professional experience with every media format, codec, or production observability stack, but I bring strong Python engineering, distributed data-processing instincts, API and database experience, technical persistence, and a genuine interest in learning the recording infrastructure domain deeply.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend, data-systems, debugging, and AI-workflow experience can contribute to Fellow's recording platform.

Sincerely,

Amir Mirzai Golpayegani
