October 20, 2026

Dear Hiring Team,

I am writing to apply for the Junior Software Developer position at SECURE in Calgary. I completed my M.Sc. in Computer Science at the University of Calgary and bring experience developing backend APIs, relational database features, and software for large-scale data processing. I am interested in this opportunity because it involves improving applications that Analytics, Finance, Operations, and field teams use in their daily work. As someone already based in Calgary, I would welcome the chance to work alongside the team at your downtown office.

As a Back-End Developer at Asr Gooyesh Pardaz, I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented registration, Google login, password reset, and email/phone verification, as well as payment-service integration and storage of plan and payment records. This work gave me practical experience translating application requirements into backend features and connecting APIs with relational data. It is the strongest connection between my background and the services supporting SECURE's web and mobile applications.

My graduate work with BigGeo, Mitacs, and the University of Calgary added experience building and improving complex software systems. I developed C++/Python pipelines for processing satellite imagery and designed methods for storing and retrieving large spatiotemporal datasets. Through C++ multithreading, I reduced processing time for ten tensors from 233 seconds to 26 seconds, while our scaled Canada-wide representation reduced storage by 38%. This required investigating bottlenecks, comparing approaches, and checking that improvements preserved the system's intended behaviour. I would bring that analytical approach to debugging and improving your applications.

I use Git, Docker, and Linux in my technical work and have experience with JavaScript and Node.js alongside my stronger Python backend background. I am also building an agentic workflow platform that integrates Google Sheets, Google Drive, and Telegram, initially prototyped in n8n and evolving toward an OpenClaw-based system. That project has given me further experience connecting services and automating repetitive tasks. I am keen to build on my API and database foundation while developing deeper experience with your React, TypeScript, and NestJS stack under the guidance of senior developers.

Clear communication and knowledge sharing have been important parts of my work. At the University of Calgary, I supported students working on AWS-based data pipelines, SQL, database design, and large-scale processing. I helped explain technical concepts and troubleshoot implementation problems, and received a Teaching Assistant Excellence award. These experiences have strengthened my ability to work through questions collaboratively and communicate the reasoning behind technical choices.

I am drawn to a role where I can see how software decisions affect the people using the tools. SECURE's combination of live applications, field workflows, and ongoing modernization offers that connection. I would bring practical backend experience, a careful approach to problem solving, and an interest in learning the operational needs behind the features the team delivers.

Thank you for considering my application. I look forward to discussing how I could contribute to SECURE's development team.

Sincerely,
Amir Mirzai Golpayegani
