Jobright.ai

Dear Hiring Team,

I am writing to apply for the Machine Learning Engineer (Canada) position at Jobright.ai. I am a Master of Science in Computer Science graduate from the University of Calgary with hands-on experience in Python, PyTorch, model evaluation, backend APIs, and data-processing pipelines. Jobright.ai's work on AI-powered job search is especially relevant to me because I have also been building an agentic job-search automation platform that analyzes job fit, tracks opportunities, and supports tailored application workflows.

My graduate research focused on building reliable machine learning and data infrastructure for large, complex datasets. In my DEM super-resolution project, I trained and evaluated PyTorch ResNet models, built data-collection and preprocessing pipelines with Streamlit, Rasterio, and Google Earth Engine, and assessed model quality with terrain-aware metrics such as RMSE, slope, TRI, TPI, and wavelet-based errors. This work strengthened my ability to design experiments, build reproducible training workflows, evaluate model behavior carefully, and communicate tradeoffs clearly.

I also developed a DGGS-based framework for real-time multiresolution management of spatiotemporal Earth observation data through my BigGeo/Mitacs research collaboration. That work required C++ and Python engineering, large-scale preprocessing, storage and retrieval design, performance optimization, and careful validation across Canada-wide datasets. Although the domain was geospatial rather than career matching, the core engineering habits transfer well to Jobright.ai's needs: structuring data, building dependable pipelines, evaluating retrieval and model behavior, and improving systems through measured iteration.

Beyond research, I have backend development experience building Django REST APIs backed by PostgreSQL, implementing authentication and payment-related logic, and contributing to AI-enabled chatbot workflows. I have also taught and mentored students in deep learning, big data applications, data-at-scale workflows, and database systems. These experiences align with the role's emphasis on clear communication, collaboration with product and engineering teammates, and translating ambiguous goals into practical technical work.

I would bring Jobright.ai a strong early-career foundation in machine learning, Python engineering, data workflows, model evaluation, and AI automation, along with genuine interest in the job-search domain. I would welcome the opportunity to contribute to models and systems that help job seekers understand opportunities, match with roles, and navigate their careers more effectively.

Thank you for considering my application. I look forward to the opportunity to discuss how my background can support Jobright.ai's machine learning and AI agent work.

Sincerely,

Amir Mirzai Golpayegani
