Dear Solace Hiring Team,

I am writing to apply for the Software Developer (Junior) role at Solace in Ottawa. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ systems, backend APIs, structured data pipelines, and AI-enabled automation workflows, I am excited by the opportunity to contribute to Solace's API and Applications team and grow inside a product engineering environment focused on reliable, real-time software.

My background aligns well with junior software development work that involves clean code, debugging, testing, documentation, and collaboration. As a back-end developer at Asr Gooyesh Pardaz, I built Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented authentication flows, payment-service logic, plan/payment records, and user-facing service features, and I contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. That experience gave me practical exposure to backend services, API design, databases, and maintaining features for real users.

I also bring strong systems and data-structure experience from my M.Sc. research with BigGeo, Mitacs, and the University of Calgary. I built Python and C++ software for processing, storing, retrieving, and evaluating large scientific datasets, designed structured tensor-based storage and retrieval workflows, and improved one C++ processing workflow from 233 seconds to 26 seconds for a 10-tensor workload. This work strengthened my ability to reason about performance, correctness, data modeling, retrieval behavior, and maintainability in codebases where small design decisions matter.

Solace's work on event-driven architecture, messaging APIs, and schema management is especially interesting to me because it sits at the intersection of software systems, data movement, and developer-facing infrastructure. My research did not use Solace products directly, but it did require designing ways to represent, access, validate, and retrieve structured data efficiently. I would be excited to bring that mindset to SDK, API, and schema-registry work while learning more deeply from experienced engineers.

I am also comfortable learning in collaborative technical environments. As a teaching assistant at the University of Calgary and a Deep Learning teaching assistant with Neuromatch Academy, I supported students through debugging, databases, data pipelines, PyTorch tutorials, and project work. I have also been building an agentic job-search automation platform using LLM workflows, Docker, Google Sheets, Google Drive, Telegram API, n8n, and OpenClaw, which has kept me actively engaged with AI-assisted development and automation practices.

I have not worked professionally with every language or tool listed for this role, especially Java, C#, Go, Kubernetes, and production messaging systems. At the same time, I bring a strong Python and C++ foundation, backend/API experience, Git and Docker familiarity, a careful approach to testing and documentation, and genuine interest in event-driven platforms and developer tools. I would be glad to discuss how I could contribute to Solace while continuing to grow into the team's stack and engineering practices.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend, Python/C++, API, data-systems, debugging, and AI workflow experience can support Solace's software development team.

Sincerely,
Amir Mirzai Golpayegani
