Arc'teryx Equipment

Dear Hiring Team,

I am writing to apply for the Associate Platform Engineer position at Arc'teryx. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am drawn to this role because it combines practical software engineering, platform reliability, learning from experienced engineers, and building systems that support real customer-facing products.

My graduate work with BigGeo, Mitacs, and the University of Calgary focused on building reliable software for large Earth observation datasets. I developed C++ and Python systems for processing, storing, and retrieving satellite imagery, automated preprocessing workflows, and built DGGS-based encoding pipelines that converted imagery into structured tensor files. This work required careful debugging, testing assumptions, documenting technical decisions, and improving performance, including reducing a 10-tensor processing workload from 233 seconds to 26 seconds.

I also bring backend engineering experience from Asr Gooyesh Pardaz, where I developed Django REST APIs, PostgreSQL-backed service logic, authentication features, and payment-service integrations for NLP, text-to-speech, and speech-to-text products. That experience maps well to the platform responsibilities in this role: building defined capabilities, fixing bugs, communicating progress, working with existing systems, and keeping service behaviour reliable for users.

I am especially interested in the way Arc'teryx describes the Platform Engineering team: supporting mobile apps, arcteryx.com, customer service interfaces, retail systems, developer self-service tools, and long-term operational stability. I enjoy engineering environments where learning, code review, documentation, and steady improvement matter. In my own automation work, I have also used AI and workflow tools to connect Google Sheets, Drive, Telegram, Docker-based services, and LLM workflows, so the role's interest in AI-assisted technical solutions also feels natural to me.

I want to be transparent that my strongest professional stack is Python, Django, PostgreSQL, Linux, Docker, and C++ rather than .NET and C#. At the same time, the role is an associate-level platform role with mentorship, and I have a strong foundation in software fundamentals, backend development, testing-minded debugging, source control, technical communication, and learning new systems quickly. I would be excited to grow into Arc'teryx's Microsoft stack while contributing immediately through the transferable engineering skills I already bring.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend, platform-adjacent, data-systems, and AI-workflow background could contribute to Arc'teryx's Engineering Excellence and Technology team.

Sincerely,  
Amir Mirzai Golpayegani
