

September 18, 2026

Dear Hiring Team,

I am writing to apply for the Junior Developer position at Convverge. I recently completed my Master of Science in Computer Science at the University of Calgary, and I am excited by the opportunity to begin the next stage of my career in Calgary while contributing to practical data and analytics solutions for real clients. My background in Python, SQL, data pipelines, databases, testing, and technical documentation aligns well with the foundation this role requires.

In my graduate work with BigGeo, Mitacs, and the University of Calgary, I built software for preparing, structuring, storing, analyzing, and retrieving large Earth observation datasets. I developed reusable C++ and Python components, automated data-preparation workflows, validated outputs, investigated performance issues, and documented methods and results for thesis and publication work. I also improved an encoding pipeline through C++ multithreading, reducing 10-tensor processing from 233 seconds to 26 seconds. That experience taught me to approach data systems with equal attention to accuracy, usability, and maintainability.

I also bring database and backend experience that supports Convverge's client delivery work. At Asr Gooyesh Pardaz, I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text services, built authentication workflows, and implemented payment-related application logic. As a teaching assistant in database systems, data at scale, and big data applications, I helped students with SQL, relational modeling, cloud data workflows, debugging, and explaining technical decisions clearly.

What interests me most about this position is its combination of hands-on development, mentorship, and visible client impact. I like that junior team members are expected to ask questions, communicate risks early, document their work, and take increasing ownership. Convverge's values of supporting each other, developing people, operating with integrity, and being an owner describe the kind of team in which I do my best work.

My strongest experience is in Python, SQL, data processing, PostgreSQL, Git, Linux, AWS-based coursework, testing, and technical communication. I have less direct hands-on experience with Power BI, Microsoft Fabric, and Azure analytics components, but the underlying work is familiar: understanding requirements, preparing and modeling data, validating results, presenting information clearly, and maintaining reliable workflows. I am motivated to build depth in the Microsoft data ecosystem through structured learning and real project work.

Thank you for considering my application. I would welcome the opportunity to discuss how my data systems background, careful problem-solving approach, and eagerness to learn can contribute to Convverge's analytics and client delivery teams.

Sincerely,  
Amir Mirzai Golpayegani
