ShyftLabs

Dear Hiring Team,

I am writing to apply for the Associate AI Engineer position at ShyftLabs in Toronto. I am a Master of Science in Computer Science graduate from the University of Calgary with hands-on experience in Python, PyTorch, backend APIs, data pipelines, and applied AI systems. ShyftLabs' focus on using data and digital solutions to build real business impact is especially appealing to me because my background sits at the intersection of machine learning, software engineering, and reliable data workflows.

My graduate research focused on building machine learning and data infrastructure for large, complex datasets. In my DEM super-resolution project, I trained and evaluated PyTorch ResNet models, built data-collection and preprocessing workflows with Streamlit, Rasterio, and Google Earth Engine, and assessed model quality with terrain-aware metrics such as RMSE, slope, TRI, TPI, and wavelet-based errors. This work strengthened my ability to design experiments, debug models, document decisions, and communicate technical tradeoffs clearly.

I also bring backend engineering experience that aligns closely with the role's emphasis on APIs, microservices, databases, and production-ready systems. As a Back-End Developer at Asr Gooyesh Pardaz, I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL; built authentication workflows; implemented payment-related backend logic; and contributed to an AI-enabled chatbot system. These projects gave me practical experience translating product requirements into reliable backend services.

Beyond my formal work, I have been building an agentic job-search automation platform that uses LLM-based workflows to analyze job fit, track opportunities, and support tailored application preparation. The project integrates Google Sheets, Google Drive, Telegram API, Docker-based tooling, and workflow automation. It reflects the kind of hands-on learning and applied AI integration that ShyftLabs describes: combining AI tools, backend systems, data workflows, and user-facing automation to solve a concrete problem.

I would bring ShyftLabs a strong early-career foundation in Python, machine learning, backend development, data pipelines, documentation, and collaborative engineering. I am excited by the opportunity to learn from experienced engineers while contributing to AI-powered features and scalable systems for enterprise clients.

Thank you for considering my application. I look forward to the opportunity to discuss how my background can support ShyftLabs' engineering team.

Sincerely,
Amir Mirzai Golpayegani
