

August 7, 2026

Dear Hiring Team,

I am writing to apply for the Junior Software Engineer remote role posted by Hire Feed. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ systems, backend APIs, data pipelines, and performance-sensitive research software, I am excited by the opportunity to contribute to scalable software solutions while continuing to grow under senior engineering mentorship.

My background aligns well with a new-grad software engineering role focused on clean code, debugging, code reviews, and cloud-oriented systems. As a back-end developer, I built Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented authentication flows, payment-service logic, and structured plan/payment records, and I contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. That experience gave me practical exposure to backend development, databases, API design, and maintaining user-facing services.

I also bring strong computer science and systems experience from my M.Sc. research. Working with BigGeo, Mitacs, and the University of Calgary, I built Python and C++ software for processing, storing, retrieving, and evaluating large scientific datasets. I developed structured data pipelines, worked through algorithmic storage and retrieval problems, and improved one C++ processing workflow from 233 seconds to 26 seconds for a 10-tensor workload. This strengthened my ability to reason about data structures, performance, debugging, and correctness.

In addition to development work, I have used Git and GitHub, Docker, Linux, PostgreSQL, AWS-based coursework, and GitHub Actions across projects. As a teaching assistant, I supported students in big data applications, data-at-scale workflows, SQL, and database systems, which strengthened my communication skills and my ability to explain technical problems clearly in collaborative environments.

I have not worked professionally with every language or production cloud-infrastructure tool that may appear in the client's stack, especially Java or Go, but I have a strong Python and C++ foundation and I learn new tools quickly. I am especially interested in roles where I can contribute to production code, participate in reviews and system design discussions, and keep building toward deeper cloud and infrastructure experience.

Thank you for considering my application. I would welcome the opportunity to discuss how my software engineering, Python/C++, backend, data pipeline, debugging, and problem-solving experience can contribute to this remote software engineering role.

Sincerely,

Amir Mirzai Golpayegani
