

August 6, 2026

Dear Hiring Team,

I am writing to apply for the AI Developer (LLM & Agentic Systems) position at WSP in Canada. With a Master of Science in Computer Science from the University of Calgary and hands-on experience in Python, backend APIs, machine learning, data pipelines, Docker-based automation, and LLM-driven agent workflows, I am excited by the opportunity to help WSP build AI-enabled applications that support complex engineering and operational decisions.

My graduate research focused on building scalable software and data-management systems for large Earth observation datasets. I developed Python and C++ workflows for data ingestion, preprocessing, storage, retrieval, and performance evaluation, including a DGGS-based framework for managing satellite imagery as structured multiresolution tensors. This work strengthened my ability to translate domain-specific data into usable software components, reason about data architecture, and communicate technical tradeoffs clearly to research and engineering collaborators.

I also bring practical backend and AI workflow experience. As a backend developer, I built Django REST APIs for NLP, text-to-speech, and speech-to-text services backed by PostgreSQL, implemented authentication and payment-service logic, and contributed to a GPT-style chatbot system. More recently, I have been building an agentic job search automation platform using LLM workflows, tool orchestration, Google Sheets and Drive integrations, Docker, n8n, OpenClaw, SearXNG, and Telegram API automation. That project has given me hands-on experience with AI-assisted workflow design, prompt and matching logic, external tool integration, and the validation discipline needed when LLM output affects real decisions.

WSP's role is especially compelling because it combines LLM applications, backend APIs, data pipelines, structured domain knowledge, and client-facing decision support across mining, resources, infrastructure, and environmental domains. My strongest match is in Python engineering, ML foundations, AI workflow automation, data pipeline design, Git-based development, documentation, and domain-data systems. I am also realistic that I would need to deepen my production experience with FastAPI, Azure-native deployments, vector search, knowledge graphs, and large-scale production agent systems, and I am motivated to grow quickly in exactly those areas.

Beyond implementation, I value the applied and collaborative nature of this work. My thesis and first-author publication required turning complex technical methods into clear explanations, reproducible experiments, and practical design decisions. As a teaching assistant, I also supported students with AWS-based data workflows, SQL, databases, debugging, and large-scale data applications. These experiences align with WSP's need for developers who can collaborate with analytics, knowledge engineering, digital product, and client teams.

Thank you for considering my application. I would welcome the opportunity to discuss how my background in Python, backend systems, data pipelines, applied ML, and agentic AI automation can contribute to WSP's next-generation AI-enabled platforms.

Sincerely,
Amir Mirzai Golpayegani
