October 20, 2026

Dear Hiring Team,

I am writing to apply for the Software Engineer (Integrations) position at Helcim. I am based in Calgary and recently completed my M.Sc. in Computer Science at the University of Calgary. My experience combines backend APIs, payment-service integration, relational databases, and C++/Python data systems. Connecting payments with the tools a business already uses is a practical problem I would enjoy working on.

As a Back-End Developer at Asr Gooyesh Pardaz, I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented payment-service integration and the storage of plan and payment records, alongside authentication features including registration, Google login, password reset, and email/phone verification. This gave me hands-on experience connecting external services with application logic and relational data. It is directly relevant to building the APIs and integrations that connect Helcim with merchant tools.

My graduate work with BigGeo, Mitacs, and the University of Calgary strengthened the systems side of my engineering experience. I built C++/Python pipelines to process satellite imagery and developed storage and retrieval methods for large spatiotemporal datasets. Using C++ multithreading, I reduced encoding time for ten tensors from 233 seconds to 26 seconds. Our scaled Canada-wide representation also reduced storage by 38%. These improvements required examining bottlenecks and data representations, comparing approaches, and measuring the results. I would bring that approach to diagnosing performance problems and designing scalable integrations.

I am also building an agentic workflow platform connecting Google Sheets, Google Drive, and Telegram for job discovery, matching, tracking, and alerts. I prototyped it in n8n and have been moving toward a more flexible OpenClaw-based system. This has reinforced my interest in making separate tools useful together. My strongest backend experience is in Python and Django, supported by SQL, Docker, Git, Linux, and experience with JavaScript and Node.js. I would build on that foundation as I learn Helcim's frameworks and tooling.

At the University of Calgary, I supported students working on AWS data pipelines, SQL, databases, and large-scale processing. I also mentored an international group through Neuromatch Academy's Deep Learning course. Explaining technical choices and helping others debug has strengthened the communication skills I would bring to collaboration with your product, data, and operational teams.

I am particularly interested in joining a Calgary team where I can see how the software improves someone's everyday work. Helcim's emphasis on transparent payments and building tools around merchants' existing workflows gives that work a clear purpose. I would welcome the opportunity to contribute my backend, payment integration, and data-systems experience while continuing to grow as an engineer.

Thank you for considering my application. I look forward to discussing how I could contribute to Helcim's integrations team.

Sincerely,
Amir Mirzai Golpayegani
