Cisco

Dear Hiring Team,

I am writing to apply for the Software Developer I (Full Time) - Canada opportunity, Job ID 56594, with Cisco. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ software, Linux-based research systems, REST APIs, SQL-backed backend services, and machine learning workflows, I am excited by the opportunity to contribute to software that supports critical platforms across applications, operating systems, databases, cloud services, and web services.

My graduate research focused on building reliable software around complex real-world datasets. Working with BigGeo, Mitacs, and the University of Calgary, I developed Python and C++ pipelines for processing, storing, retrieving, and analyzing large Earth observation datasets. I automated satellite imagery preprocessing, designed DGGS-based workflows that transformed imagery into structured tensor files, and optimized C++ encoding performance with multithreading, reducing a 10-tensor processing workflow from 233 seconds to 26 seconds. This work gave me practical experience with debugging, testing ideas against real data, performance optimization, reproducibility, and building software that has to behave reliably beyond a small prototype.

That background aligns well with this role's focus on programming, scripting, quality assurance, debugging, operating systems, databases, cloud platforms, and machine learning. I have recent hands-on experience with Python and C++, strong comfort working in Linux environments, and a habit of approaching software development through careful testing, measurement, and iteration. I have also built backend systems with Django REST APIs and PostgreSQL, implemented authentication and payment-related backend logic, and worked with Docker, Git, AWS-based course infrastructure, and GitHub Actions.

I am also drawn to Cisco because the role sits close to the kind of engineering environment I want to grow in: practical software, large-scale infrastructure, cloud and security-adjacent systems, and products where good engineering decisions affect many users. I have not worked deeply in networking or embedded systems yet, but my background in C++, operating-system fundamentals, backend development, machine learning, and data-intensive software gives me a strong base for learning those areas quickly and contributing with care.

Alongside my technical experience, I bring clear communication and a collaborative working style. As a teaching assistant at the University of Calgary, I mentored students in big data applications, AWS-based workflows, SQL, database design, debugging, and large-scale data processing. These experiences strengthened my ability to explain technical decisions, learn quickly from feedback, and work patiently through difficult engineering problems.

Thank you for considering my application. I would welcome the opportunity to discuss how my Python, C++, Linux, backend, debugging, data-processing, and machine learning experience can contribute to Cisco's software engineering teams.

Sincerely,

Amir Mirzai Golpayegani
