

August 6, 2026

Dear Hiring Team,

I am writing to apply for the Software Engineer, Backend position at StackAdapt. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ software, REST APIs, relational database-backed services, and scalable data-processing systems, I am excited by StackAdapt's work at the intersection of high-throughput backend engineering, data, and machine learning.

In my graduate research with BigGeo and Mitacs, I built C++ and Python software for processing, storing, and retrieving large Earth observation datasets. I developed data encoding pipelines, automated satellite imagery preprocessing, and worked on storage and retrieval methods for Canada-wide geospatial data containing more than 1,100 GeoTIFF tiles and over 16,000 structured tensors. I also improved processing performance through C++ multithreading, reducing a representative 10-tensor workload from 233 seconds to 26 seconds. This experience aligns well with StackAdapt's need for engineers who care about data-intensive systems, optimization, memory-aware code, and reliable processing at scale.

I also bring professional backend development experience from Asr Gooyesh Pardaz, where I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented authentication features, payment-service logic, and database records for plan and payment workflows, while contributing to a WebRTC-based chatbot system. Although my production backend work has been primarily in Python rather than Go, my computer engineering foundation, C++ systems work, and experience learning new technical stacks give me confidence that I can ramp up quickly in StackAdapt's backend environment.

StackAdapt's remote-first engineering culture and the scale of its platform are especially compelling to me. The opportunity to work on distributed microservices, large datasets, databases, event-driven systems, and performance-sensitive advertising infrastructure is closely connected to the parts of software engineering I enjoy most: making complex systems practical, measurable, and efficient. I would be particularly excited to contribute to backend teams working on data-heavy integrations, high-throughput services, or ML-adjacent platform capabilities.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend development experience, large-scale data systems background, and strong problem-solving foundation can contribute to StackAdapt.

Sincerely,
Amir Mirzai Golpayegani
