

August 8, 2026

Dear Neon One Hiring Team,

I am writing to apply for the Data Scientist position at Neon One. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ systems for machine learning, large-scale data processing, structured data storage, and AI workflow automation, I am excited by the opportunity to help build a strong data foundation for AI agents and decision-support tools in nonprofit technology.

My graduate research focused on making large and complex datasets usable, queryable, and reliable. Working with BigGeo, Mitacs, and the University of Calgary, I built Python and C++ software for processing, storing, retrieving, and evaluating Earth observation data. I developed structured tensor-based data models, automated preprocessing pipelines, documented modeling assumptions, and improved one C++ processing workflow from 233 seconds to 26 seconds for a 10-tensor workload. That work strengthened my ability to reason about data structure, retrieval behavior, scalability, performance, and the tradeoffs involved in turning raw data into useful analytical systems.

I also bring practical backend and relational-data experience. As a back-end developer at Asr Gooyesh Pardaz, I built Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented authentication flows, payment-service logic, plan/payment records, and user-facing service features, and I contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. This experience gave me a useful bridge between data, application logic, and product-facing workflows.

Neon One's focus on a greenfield data layer for AI agents is especially interesting to me because I have been building an agentic job-search automation platform using LLM workflows, Google Sheets, Google Drive, Telegram API, Docker, n8n, and OpenClaw. That project has pushed me to think carefully about how data is structured, updated, retrieved, and used by AI-assisted systems while keeping the outputs transparent and reliable.

In addition to technical work, I have strong experience explaining complex ideas and supporting knowledge transfer. As a teaching assistant at the University of Calgary and a Deep Learning teaching assistant with Neuromatch Academy, I helped students work through data pipelines, databases, debugging, PyTorch tutorials, and research projects. I am comfortable writing clear documentation, communicating assumptions, and translating technical work for mixed audiences.

I have not worked directly with Salesforce Data 360, Agentforce, or nonprofit CRM data at production scale, and I understand those are important parts of this role. At the same time, I bring a strong foundation in Python, machine learning, relational data, backend APIs, large-scale data processing, AI workflows, documentation, and careful technical communication. I would be glad to discuss how I could contribute to Neon One's data science efforts while ramping up quickly on the Salesforce and nonprofit-data parts of the stack.

Thank you for considering my application. I would welcome the opportunity to discuss how my data science, software engineering, AI workflow, and large-data systems experience can support Neon One's mission and product direction.

Sincerely,  
Amir Mirzai Golpayegani
