

September 2, 2026

Dear Hiring Team,

I am writing to apply for the Software Developer position at Intelx Technologies ULC. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building backend APIs, database-backed services, and scalable Python/C++ data systems, I am excited by the opportunity to contribute to software products that help organizations manage safety, quality, and operational responsibility more effectively.

Intelx stands out to me because the role combines practical product engineering with a culture of craftsmanship, continuous learning, DevOps, and written collaboration. I like software work where the goal is not only to build features, but to build systems that are understandable, reliable, secure, and useful for real users. The chance to work on web-based EHSQ products used by enterprise clients is especially appealing because the software has a direct connection to safer and more sustainable operations.

In my previous back-end developer role, I built Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text services. I implemented authentication workflows, payment-service integration, service-plan logic, and relational data models, while contributing to a WebRTC-based chatbot system using GPT-style responses and FAQ data. This gave me practical experience with backend service design, database-driven application logic, debugging, and production-facing feature work.

My graduate research also strengthened my software engineering foundation. I built C++ and Python systems for large-scale Earth observation data processing, including automated preprocessing workflows, structured tensor datasets, and performance-sensitive retrieval methods. I improved processing speed through multithreaded implementation and reduced storage requirements by 38% on a Canada-wide dataset. Although the domain was research-oriented, the engineering challenges were familiar product problems: making complex data reliable, improving performance, documenting technical decisions, and iterating when requirements changed.

I also bring experience with JavaScript, Node.js, SQL, Git, Linux, Docker, AWS-based coursework, GitHub Actions, and agile technical collaboration. As a teaching assistant in big data applications, data-at-scale workflows, and database systems, I helped students debug software and data workflows and explain design decisions clearly. I would bring that same combination of curiosity, persistence, and communication to Intelx's agile engineering teams.

I recognize that this role emphasizes React, TypeScript, C#, .NET, MongoDB, and broader full-stack web development more deeply than my recent work has. At the same time, I have a strong software foundation, real backend experience, and a record of learning new technical stacks quickly and carefully. I would be excited to grow into Intelx's stack while contributing immediately in backend logic, APIs, SQL, debugging, documentation, and engineering discipline.

Thank you for considering my application. I would welcome the opportunity to discuss how my software development, data systems, and applied research background can contribute to Intelx's product engineering team.

Sincerely,
Amir Mirzai Golpayegani
