Dear Canonical Hiring Team,

I am writing to apply for the Junior Software Developer - Observability position at Canonical. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python and C++ systems on Linux, backend services, data-processing pipelines, and research infrastructure, I am excited by the opportunity to contribute to Canonical's cloud-native monitoring stack and open-source engineering work.

My graduate research focused on developing scalable software and data-management solutions for large Earth observation datasets. I built C++ and Python pipelines for processing, encoding, storing, and retrieving satellite imagery, and I worked extensively in Linux-based development environments using Git, debugging tools, reproducible workflows, and careful documentation. This work required the same habits Canonical emphasizes: quality-oriented engineering, attention to edge cases, and maintainable software for complex environments.

In my research software developer role with BigGeo, Mitacs, and the University of Calgary, I designed data pipelines that handled large raster datasets, converted imagery into structured tensor files, and improved processing performance through C++ multithreading. I also used Python tools such as Rasterio, GDAL, NumPy, pandas, and PyTorch to build, validate, and troubleshoot scientific workflows. These projects strengthened my ability to write practical code, test assumptions, investigate failures, and communicate technical tradeoffs clearly.

I also bring backend engineering experience from my time at Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL, implemented authentication and payment-related features, and contributed to client-facing communication systems. In my teaching assistant roles, I supported students with AWS-based data pipelines, large-scale data processing, SQL, debugging, and project work. These experiences make me comfortable working with distributed teams, reviewing technical decisions, and helping others solve engineering problems.

The observability focus is especially interesting to me because it connects software quality with visibility into real systems. Although I would continue deepening my production experience with Go, Kubernetes, and dedicated observability tools, I already bring a strong foundation in Python, Linux, containers, distributed data workflows, debugging, visualization, and documentation. I like work where small engineering improvements make systems easier to understand, operate, and trust.

Canonical interests me because Ubuntu sits at the center of the open-source, cloud, AI, and developer ecosystems I use regularly. The role's focus on Python, Linux, cloud-native systems, testing, documentation, and collaboration with a globally distributed team feels like a strong match for both my technical background and the way I like to work. I am also comfortable with remote collaboration and would be willing to travel for the in-person team events described in the posting.

Thank you for considering my application. I would welcome the opportunity to bring my Python, Linux, data infrastructure, and research engineering experience to Canonical's Observability team.

Sincerely,

Amir Mirzai Golpayegani
