

September 21, 2026

Dear Hiring Team,

I am writing to apply for the Backend Developer (Remote) position with Jobs Ai. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python and C++ software, Django REST APIs, SQL-backed services, data pipelines, and automation workflows, I would be excited to contribute to reliable backend systems for your client.

The role's focus on designing, developing, maintaining, debugging, optimizing, reviewing, and documenting software fits the kind of engineering work I have done across both product and research environments. In my previous back-end developer role at Asr Gooyesh Pardaz, I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I also built authentication workflows, implemented payment-service logic, stored plan and payment records in relational tables, and contributed to a WebRTC-based chatbot system that used GPT-style responses and FAQ data to answer client questions.

My graduate research further strengthened my ability to build dependable software around complex data. I developed C++ and Python pipelines for processing, encoding, storing, validating, and retrieving large Earth observation datasets. This work required clean implementation, Git-based iteration, debugging, documentation, attention to edge cases, and performance optimization, including improving one encoding workflow from 233 seconds to 26 seconds through multithreaded C++ implementation.

I also bring a strong practical foundation in Python, SQL, Git, Linux, Docker, and workflow automation. In my current agentic job-search automation project, I am integrating Google Sheets, Google Drive, Docker-based services, Telegram API, LLM workflows, and human review steps into a system that searches jobs, evaluates fit, and tracks application actions. That project has reinforced the same habits this role emphasizes: writing maintainable code, connecting systems through APIs, debugging failures carefully, documenting decisions, and designing workflows that remain usable over time.

I understand that the exact client and stack are not fully disclosed in the posting, but the core requirements match my strengths: Python-oriented backend development, databases and SQL, Git, software development fundamentals, troubleshooting, code review, documentation, and remote collaboration. I am also comfortable learning the parts of the stack that are specific to the client's environment, including Java or JavaScript if needed.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend development, data-systems, and automation experience can support this remote software development role.

Sincerely,
Amir Mirzai Golpayegani
