

September 2, 2026

Dear Hiring Team,

I am writing to apply for the Data Engineer - Remote position with Aurora Cannabis Inc. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python, C++, SQL, and data-processing systems for large scientific datasets, I am excited by the opportunity to help Aurora build reliable data foundations for business, analytics, and operational decision-making.

Aurora stands out to me because it is an Alberta-rooted Canadian company operating in a highly regulated, science-driven industry with real operational complexity. That combination is genuinely interesting to me. I like data work most when the pipelines are not abstract exercises, but part of a system that needs accuracy, traceability, quality, and practical usefulness for many teams. Aurora's focus on medical cannabis, global operations, and disciplined execution makes the Data Engineer role feel especially meaningful.

My graduate research focused on scalable management of Earth observation and geospatial data. I built C++ and Python software for ingesting, transforming, storing, and retrieving large satellite-imagery datasets, including automated preprocessing workflows with GDAL, Rasterio, SNAP, and satellite data APIs. I also designed a DGGS-based data framework that converted imagery into structured tensor datasets, reduced storage requirements by 38% on a Canada-wide dataset, and improved processing performance through multithreaded implementation. This work gave me practical experience with data ingestion, transformation, validation, storage design, metadata-aware workflows, and the tradeoffs involved in making complex data usable at scale.

I also bring strong Python, SQL, and backend experience. As a back-end developer, I built Django REST APIs backed by PostgreSQL and implemented production-facing logic for authentication, service plans, and payment records. As a teaching assistant for Developing Big Data Applications, Working with Data at Scale, and Database Management Systems, I mentored students on cloud storage, AWS-based data pipelines, scalable workflows, SQL, and debugging. These experiences align well with Aurora's need for someone who can work across data engineering, software development practices, documentation, troubleshooting, and communication with technical and non-technical stakeholders.

My strongest cloud-data exposure has been through AWS-based coursework, teaching, and scalable research workflows, and I would bring the same disciplined learning approach to Aurora's Azure, Synapse, Data Factory, and Databricks environment. The core foundation is already there: Python, SQL, data modelling concepts, reproducible pipelines, Git-based development, and a research background that required learning new systems quickly and using them carefully. I am particularly motivated by roles where data quality, governance, lineage, and reliability matter.

Thank you for considering my application. I would welcome the opportunity to discuss how my data engineering, software development, and applied research background can contribute to Aurora's analytics and enterprise data platform work.

Sincerely,
Amir Mirzai Golpayegani
