

October 6, 2026

Dear Hiring Team,

I am writing to apply for the Junior Software Engineer position, Requisition ID 274681, at Scotiabank. I recently completed my M.Sc. in Computer Science at the University of Calgary and bring experience in Python back-end development, C++ data systems, REST APIs, and relational databases. The Global Payment Technology role interests me because it combines software development with the practical work of keeping systems reliable, diagnosing problems, and improving how information moves between services.

As a Back-End Developer at Asr Gooyesh Pardaz, I developed Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I implemented payment-service integration and the storage of plan and payment records, along with registration, Google login, password reset, and email/phone verification. That work gave me experience translating service requirements into backend logic and managing the relationships between application features and database records. It is the most direct connection between my background and the payment-processing applications your team supports.

During my graduate research with BigGeo, Mitacs, and the University of Calgary, I developed C++/Python software for processing, storing, and retrieving large volumes of Earth observation data. I designed encoding pipelines and multiresolution retrieval methods, and investigated computational and storage bottlenecks. By using C++ multithreading, I reduced processing time for ten tensors from 233 seconds to 26 seconds; our scaled Canada-wide representation also reduced storage by 38%. This work strengthened my ability to break down complex systems, compare implementation choices, and measure whether changes improved performance.

Linux is a regular part of my development environment, and I use Git and Docker in my technical work. I am comfortable working from the terminal, using SSH, installing and troubleshooting software, and developing Python and C++ code. My strongest hands-on backend experience is with Python and Django. I would bring that foundation in APIs, databases, and software development to learning the team's Java-based services and payment integration tools, without treating familiarity with one stack as a substitute for experience in another.

I also bring experience helping others solve technical problems. As a teaching assistant at the University of Calgary, I supported students working on AWS-based data pipelines, large-scale data processing, SQL, and database design. I explained technical concepts, assisted with debugging, and provided structured feedback. My research led to a first-author publication and required clear descriptions of the system's design and performance. These experiences would support collaboration with developers and stakeholders, as well as the documentation your role calls for.

I am interested in moving into a software engineering role where the quality of everyday implementation and troubleshooting has a direct effect on a service people depend on. Scotiabank's payment technology team offers that kind of work, along with an opportunity to expand my engineering experience in a more operational setting.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend development and data-systems experience could contribute to your team.

Sincerely,
Amir Mirzai Golpayegani
