Dear Canonical Hiring Team,

I am writing to apply for the Software Engineer (Python/Linux/Packaging) position at Canonical, Requisition ID 523. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python and C++ software on Linux, backend services, automation workflows, and research infrastructure, I am excited by the opportunity to contribute to Canonical's developer tooling for snaps, charms, and rocks.

What interests me about this role is the combination of Python engineering, Linux distribution thinking, build systems, and practical tools that make developers' lives easier. I have used Ubuntu and Linux-based environments throughout my research and development work, and I enjoy engineering where reliability, documentation, reproducibility, and small workflow improvements turn into better developer experience.

My graduate research focused on developing scalable software and data-management solutions for large Earth observation datasets. As a research software developer with BigGeo, Mitacs, and the University of Calgary, I built C++ and Python pipelines for processing, encoding, storing, and retrieving satellite imagery. I worked in Linux development environments using Git, debugging tools, reproducible workflows, and documentation, and improved one encoding workflow from 233 seconds to 26 seconds through C++ multithreading.

I also bring backend engineering experience from my time at Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL, implemented authentication and payment-related features, and contributed to client-facing communication systems. In my teaching assistant roles, I supported students with AWS-based data pipelines, cloud storage, debugging, SQL, and project work. These experiences make me comfortable learning unfamiliar toolchains, explaining technical choices, and helping others move from a problem to a working implementation.

I would be ready to deepen my production experience with Snapcraft, Charmcraft, Rockcraft, LXD, Kubernetes, and cross-compilation. At the same time, I bring a strong foundation in Python, Linux, Docker, Git, CI workflows, debugging, technical writing, and build-oriented problem solving. I am genuinely interested in packaging formats and developer automation, and I would be motivated to grow into the details of Canonical's ecosystem while contributing carefully from my existing strengths.

Thank you for considering my application. I would welcome the opportunity to bring my Python, Linux, data infrastructure, and research engineering experience to Canonical's developer tooling work.

Sincerely,

Amir Mirzai Golpayegani
