SureWerx

Dear Hiring Team,

I am writing to apply for the Junior Data Analyst position at SureWerx. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am interested in this role because it is a practical data position: understanding business needs, preparing reliable data, building useful reporting workflows, and helping stakeholders make better decisions from the information already available to the organization.

My graduate research focused on building data-processing and data-management systems for large geospatial and Earth observation datasets. I developed Python and C++ pipelines for collecting, cleaning, transforming, validating, storing, and retrieving satellite imagery and terrain data. The work required close attention to data quality, reproducibility, documentation, and performance, because small issues in preprocessing or storage could affect every later analysis step.

I also bring backend and database experience from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I implemented service-plan logic, authentication features, payment-service integration, and relational records for plan and payment workflows. This experience strengthened my ability to work with structured data, understand downstream users of a system, and connect technical implementation to real business processes.

Although my strongest hands-on tools are Python, SQL, PostgreSQL, pandas, Streamlit, and technical data pipelines rather than Power BI or Microsoft Fabric, the responsibilities of this role are very familiar to me. I have translated messy data requirements into structured workflows, checked data outputs carefully, communicated results to technical and non-technical audiences, and built tools that make complex datasets easier to use. I am confident I can quickly grow into SureWerx's BI stack while contributing strong fundamentals in data validation, analysis, and problem solving from the start.

As a teaching assistant at the University of Calgary, I supported students in big data applications, data-at-scale workflows, and database management systems. I explained SQL, debugging, data pipelines, and analytical concepts, reviewed projects, and gave structured feedback. That work helped me develop the patience and clarity needed for analyst roles where understanding the question, communicating assumptions, and making the result usable are just as important as writing the query or building the report.

SureWerx interests me because the company operates around real products, operations, customers, and safety-focused brands. Data work in that environment has a direct practical purpose: helping teams see what is happening, improve processes, and make more confident decisions. I would be excited to bring my data-processing background, SQL and software experience, careful documentation habits, and remote-collaboration discipline to your IT and Data Analytics team.

Thank you for considering my application. I would welcome the opportunity to discuss how my data engineering, SQL-backed backend development, research software, and technical communication experience can contribute to SureWerx as a Junior Data Analyst.

Sincerely,
Amir Mirzai Golpayegani
