Certn

Dear Hiring Team,

I am writing to apply for the Intermediate Developer position at Certn. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am drawn to this role because it combines Python software development, relational databases, REST APIs, documentation, production support, and practical collaboration in a remote-first product environment.

My professional backend experience comes from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I worked on registration, Google login, password reset, email and phone verification, payment-service integration, and relational records for service plans and transactions. That role gave me direct experience building API behavior around real user workflows, thinking carefully about authentication and data consistency, and maintaining backend code that supported customer-facing services.

During my M.Sc., I also built larger research software systems in Python and C++ for geospatial and Earth observation data. I developed pipelines for data collection, preprocessing, storage, retrieval, validation, and analysis, including a DGGS-based framework for managing large spatiotemporal satellite datasets. This work required clean implementation, performance awareness, Git-based iteration, reproducible workflows, documentation, and careful communication of technical tradeoffs through a thesis and first-author publication.

I would also bring strong collaboration and mentoring experience. As a teaching assistant at the University of Calgary, I supported students in database systems, data-at-scale, and big-data application courses. I explained SQL, database design, data pipelines, debugging, and project decisions to students with different levels of experience. More recently, as a Deep Learning Teaching Assistant with Neuromatch Academy, I helped project groups move from initial questions to working PyTorch implementations and final presentations.

Certn's role feels like a strong fit because it asks for a developer who can contribute across the full software development cycle, write clear intent-revealing code, work closely with technical and non-technical teammates, support reliability in live systems, and help others grow. My strongest fit is in Python, Django, REST APIs, PostgreSQL, documentation, data workflows, Git, Linux, and analytical debugging. I also have working familiarity with Docker, AWS, JavaScript, and AI workflows, and I am motivated to keep growing in production SaaS delivery, observability, and front-end collaboration.

Thank you for considering my application. I would welcome the opportunity to discuss how my Python backend, database, research software, and mentoring background could contribute to Certn's engineering team.

Sincerely,  
Amir Mirzai Golpayegani
