

September 22, 2026

Dear Hiring Team,

I am writing to apply for the Junior Software Engineer (Remote) position with Hire Feed's client. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ software, backend APIs, automation workflows, and scalable data-processing systems, I am excited by the opportunity to contribute to full-time software engineering work in a new-grad role.

What draws me to this position is its focus on clean, maintainable software, collaborative engineering, debugging, code review, and scalable cloud-oriented systems. My strongest language is Python, and I have used it across backend services, scientific software, data pipelines, machine-learning workflows, and automation projects. I also bring a strong foundation in C++, SQL, Git, Linux, Docker, PostgreSQL, AWS-based coursework and teaching support, and practical problem solving.

In my graduate research, I built Python and C++ software for managing large Earth observation datasets. This work required designing data structures, writing reliable processing and retrieval code, debugging incorrect outputs, documenting workflows, measuring performance, and improving one C++ encoding workload from 233 seconds to 26 seconds through multithreading. The project became my M.Sc. thesis and a first-author publication, but it was also a real engineering exercise in turning an open-ended problem into working, tested, and measured software.

I also have professional backend experience from my time at Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL. I implemented authentication and verification flows, service-plan APIs, payment-related backend logic, and integrations for communication and NLP services. That experience gave me practical exposure to API design, relational data modeling, request debugging, and the importance of writing code that other developers can understand and maintain.

Beyond formal work, I have been building an agentic job-search automation platform using Docker Compose, n8n, LLM-based workflows, Google Sheets and Drive integrations, SearXNG, and Telegram. This personal project has strengthened my interest in reliable workflow automation, configuration, integration debugging, and developer-facing systems where small design choices can make a tool much easier to use.

I would bring curiosity, discipline, strong Python skills, and a research-trained approach to debugging and learning. While Java and Go are not my primary languages, I am comfortable learning new technical stacks and would be ready to grow in the client's preferred environment. I would welcome the chance to contribute to scalable software solutions while learning from senior engineers and steadily building deeper production engineering experience.

Thank you for considering my application. I would be glad to discuss how my software engineering, backend, data-systems, and automation experience can contribute to this role.

Sincerely,
Amir Mirzai Golpayegani
