Circle Cardiovascular Imaging

Dear Hiring Team,

I am writing to apply for the Platform Software Developer position, requisition 2026-015, at Circle Cardiovascular Imaging in Calgary. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building Python/C++ software, backend APIs, data pipelines, cloud-aware workflows, and AI automation systems, I am excited by the opportunity to contribute to intelligent capabilities within the cvi42 platform.

What interests me most about this role is the combination of platform engineering, applied AI, and healthcare impact. Circle's work sits close to real clinical decision support, where software reliability, security, usability, and careful integration matter. The role's focus on cloud integrations, APIs, NLP, conversational experiences, and agentic AI workflows connects directly with the kind of software and AI systems I have been building.

My graduate research at the University of Calgary focused on reliable software and data systems for large Earth observation datasets. I developed C++ and Python pipelines for processing, encoding, validating, storing, and retrieving satellite imagery, and improved one encoding workflow from 233 seconds to 26 seconds through multi-threaded C++ implementation. This work required disciplined debugging, documentation, testing, performance measurement, and translating research requirements into maintainable software.

I also bring backend product experience from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I built authentication workflows, implemented payment-service logic, and contributed to a WebRTC-based chatbot system using GPT-style responses and FAQ data. Those responsibilities map well to platform services, API design, integration work, and building user-facing intelligent features with reliability in mind.

More recently, I have been building an agentic job-search automation platform that integrates LLM workflows, Google Sheets, Google Drive, Docker-based services, Telegram API, workflow automation tools, and human review steps. This project has strengthened my practical experience with agentic workflows, API integrations, automation, debugging, and designing systems that remain useful and auditable over time.

I understand that I would need to deepen my production experience with Kubernetes, Go, TypeScript/Angular, and clinical software compliance. At the same time, I can bring immediate value through Python, C++, backend/API development, Docker, Git, Linux, applied AI workflows, secure engineering habits, and a strong Calgary-based interest in Circle's mission. I would be excited to contribute to software that helps clinicians use cardiovascular imaging more effectively.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend, platform, AI workflow, and research software background can support Circle Cardiovascular Imaging's next generation of intelligent product capabilities.

Sincerely,

Amir Mirzai Golpayegani
