General Dynamics Mission Systems–Canada

Dear Hiring Team,

I am writing to apply for the Software Engineering, Developer position with General Dynamics Mission Systems–Canada in Calgary. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am interested in this role because it is a strong early-career software engineering opportunity focused on building reliable systems, learning deeply, and contributing to mission-critical technology.

My graduate research with BigGeo, Mitacs, and the University of Calgary focused on building C++ and Python software for large Earth observation datasets. I developed scalable processing, storage, and retrieval workflows; implemented performance-sensitive components; automated preprocessing pipelines; and documented technical decisions through my thesis and a first-author publication. This work strengthened the same habits I would bring to your team: careful debugging, structured design, performance awareness, and clear communication.

I also bring backend software experience from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I implemented authentication features, service-plan logic, payment-service integration, and relational records for customer plans and payments. That experience gave me practical exposure to software lifecycle work where correctness, maintainability, and user-facing reliability matter.

The posting emphasizes C#, Java, C++, software engineering processes, design patterns, ownership, and willingness to learn. My strongest professional and research languages are C++, Python, SQL, and JavaScript rather than C# or Java, but the core engineering responsibilities are familiar: understand requirements, design clean components, test assumptions, debug unfamiliar systems, document work, and keep improving based on evidence. I am comfortable learning new languages and tools when the fundamentals are clear.

As a teaching assistant at the University of Calgary, I supported students in big data applications, data-at-scale workflows, and database management systems. I explained technical concepts, reviewed software and data projects, helped students debug issues, and gave structured feedback. This reinforced my ability to collaborate patiently, ask good questions, and communicate technical tradeoffs in a way that helps a team move forward.

I am based in Calgary and would be excited to contribute locally to General Dynamics Mission Systems–Canada. I understand that the role is connected to defence and security work and requires security assessment and Controlled Goods eligibility. I would approach that responsibility seriously, with attention to reliability, documentation, and professional judgment.

Thank you for considering my application. I would welcome the opportunity to discuss how my C++/Python software experience, backend development background, research discipline, and willingness to learn can contribute to your Calgary engineering team.

Sincerely,
Amir Mirzai Golpayegani
