

August 17, 2026

Dear Microsoft Hiring Team,

I am writing to apply for the Software Engineer position at Microsoft. With a Master of Science in Computer Science from the University of Calgary and experience building Python and C++ software for data-intensive systems, backend APIs, machine learning workflows, and automation tools, I am excited by the opportunity to contribute to reliable, maintainable software used at Microsoft scale.

My graduate research has centered on building software systems for large geospatial and Earth observation datasets. I developed C++ and Python components for processing, encoding, storing, and retrieving complex satellite data, and improved one encoding workflow from 233 seconds to 26 seconds using C++ multithreading. This work required writing clean code, debugging data and performance issues, validating outputs carefully, and documenting technical assumptions so that the system could be understood and extended.

I also bring practical backend engineering experience from my role as a Back-End Developer at Asr Gooyesh Pardaz, where I designed and implemented Django REST APIs backed by PostgreSQL for NLP, speech-to-text, and text-to-speech services. I built authentication workflows, contributed to payment-service integration, and worked on a WebRTC-based chatbot system. These projects strengthened the software-engineering habits that matter for this role: understanding requirements, implementing service logic, testing behavior, reviewing edge cases, and maintaining clear interfaces.

In my research and teaching work, I have also built reproducible machine-learning pipelines in Python and PyTorch, supported students through debugging and cloud-based data workflows, and communicated technical trade-offs to both technical and less technical audiences. I enjoy software work that sits close to real users and real constraints: making systems more reliable, improving performance, explaining decisions clearly, and learning the team's technology stack deeply enough to contribute with care.

Microsoft's focus on building broadly useful products and services is especially appealing to me because my strongest work has come from combining research depth with practical engineering. I would be grateful for the opportunity to bring my Python, C++, backend, data-systems, and documentation experience to this Software Engineer role.

Thank you for considering my application. I look forward to the opportunity to discuss how my background can contribute to Microsoft.

Sincerely,
Amir Mirzai Golpayegani
