Scotiabank

Dear Hiring Team,

I am writing to apply for the Junior Software Engineer position, Requisition ID 264671, with Scotiabank's Global Payments Technology team in Toronto. I am a Master of Science in Computer Science graduate from the University of Calgary with experience building backend services, REST APIs, database-backed application logic, and scalable research software. I am excited by this role because it combines junior software engineering growth with payments technology, cloud platform exposure, documentation, testing, and collaborative delivery.

My backend experience includes developing Django REST APIs for NLP, text-to-speech, and speech-to-text service plans backed by PostgreSQL. I built authentication features, implemented payment-service integration logic, and stored plan and payment records in a relational database. This work gave me practical experience writing maintainable service code, connecting backend logic to product requirements, debugging issues, and working carefully with user-facing workflows.

In my graduate research, I built C++ and Python systems for scalable Earth observation data processing, storage, and retrieval. I developed data encoding pipelines, automated preprocessing workflows, and improved performance through multithreading. Although the domain was geospatial rather than banking, the engineering habits transfer directly: understand requirements, build reliable code, document decisions, test assumptions, and improve systems incrementally.

I also bring teaching and collaboration experience that fits a junior engineering environment. As a teaching assistant in big data, data-at-scale, database systems, and deep learning courses, I helped students debug projects, understand SQL and data pipelines, reason about AWS-based workflows, and communicate technical decisions. I enjoy learning from senior engineers, asking precise questions, participating in reviews, and helping create an inclusive team environment.

The role's requirements align well with my background in Python, JavaScript, SQL, RESTful APIs, PostgreSQL, Git, Linux, and CI/CD concepts. I also have exposure to AWS-based data workflows and am eager to deepen my experience with Scotiabank's cloud deployment practices, including GCP and Azure. I would bring strong problem-solving, careful communication, and a genuine willingness to learn the team's tools, standards, and controls.

Thank you for considering my application. I would welcome the opportunity to discuss how my backend development, data systems, and collaborative technical experience can contribute to Scotiabank's Global Payments Technology team.

Sincerely,
Amir Mirzai Golpayegani
