

August 24, 2026

Dear Canadian Tire Hiring Team,

I am writing to apply for the Data Scientist position with Canadian Tire Corporation in Calgary. With a Master of Science in Computer Science from the University of Calgary and hands-on experience in Python, SQL, machine learning, data pipelines, backend APIs, and automation workflows, I am excited by the opportunity to support store labour planning, operational efficiency, and analytics for SportChek and Mark's.

My graduate research focused on scalable machine learning and data-management solutions for large geospatial and Earth observation datasets. I built Python and C++ workflows for data preprocessing, validation, storage, retrieval, model evaluation, and performance analysis. This experience maps well to a role that requires comfort with large datasets, clear analysis, repeatable workflows, and turning technical findings into reports that support business decisions.

One of my primary research projects examined the reliability of deep-learning models for digital elevation model super-resolution. Through systematic experimentation, I found how random data splitting could produce overly optimistic results and designed region-based validation methods that better reflected real-world behavior. That kind of careful evaluation is directly relevant to forecasting, planning, self-serve analytics, and predictive analytics where decision-makers need trustworthy results rather than impressive-looking numbers.

I also bring backend, database, and automation experience that would help me contribute beyond analysis alone. As a Back-End Developer, I built Django REST APIs backed by PostgreSQL and maintained service and database behavior for NLP and speech products. As a teaching assistant, I supported students with AWS-based data pipelines, SQL, large-scale data processing, debugging, and database coursework. More recently, I have been building an agentic workflow automation platform using LLM workflows, Google Sheets, Google Drive, Docker, and API integrations.

I understand that this role leans into finance, store operations, planning, and BI rather than pure machine learning research. While I would continue building deeper FP&A and retail-domain experience, I bring a strong foundation in Python, SQL, data quality, automation, modeling, and technical communication. I am comfortable explaining analytical work to technical and non-technical audiences, documenting assumptions, and improving workflows based on evidence and feedback.

Canadian Tire interests me because the role connects analytics to practical decisions across a large Canadian retail network. The opportunity to help improve labour planning, self-serve analytics, operational efficiency, and data-driven strategy across hundreds of stores feels meaningful and close to the kind of applied, useful data work I want to do. I am based in Calgary and comfortable with the on-site requirement.

Thank you for considering my application. I look forward to the opportunity to discuss how my Python, SQL, machine learning, automation, reporting, and data-processing background can contribute to Canadian Tire Corporation.

Sincerely,
Amir Mirzai Golpayegani
