TEHORA inc.

Dear Hiring Team,

I am writing to apply for the Programmeur(euse) junior BackEnd Python position at TEHORA inc. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am interested in this role because it is centered on practical Python backend development: APIs, databases, testing, deployment-oriented workflows, documentation, and maintainable software in a primarily remote environment.

My professional backend experience comes from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I worked on registration, Google login, password reset, email and phone verification, payment-service integration, and relational records for service plans and transactions. This gave me hands-on experience building API behavior around real user workflows, debugging backend logic, and keeping database-backed services understandable and maintainable.

During my M.Sc., I also built larger Python and C++ research software systems for geospatial and Earth observation data. I developed pipelines for data collection, preprocessing, storage, retrieval, validation, and analysis, including a DGGS-based framework for managing large spatiotemporal satellite datasets. This work required Git-based iteration, reproducible workflows, Linux-based development, performance awareness, documentation, and careful communication of technical decisions through a thesis and first-author publication.

I would also bring strong data and debugging experience. In my DEM super-resolution project, I built Python workflows using NumPy, pandas, Rasterio, Google Earth Engine, and PyTorch, then evaluated outputs with statistical and domain-specific metrics. The project strengthened my ability to trace problems across data preparation, software implementation, and evaluation results, which is directly relevant to writing and maintaining reliable backend services.

My strongest fit for this position is in Python, REST APIs, PostgreSQL, SQL, Git, Linux, Docker, data workflows, debugging, and technical documentation. While my direct experience is with Django rather than FastAPI and my Azure Functions, Azure DevOps, API Management, Service Bus, and NoSQL experience is lighter, I have a strong foundation in backend concepts and I learn new frameworks quickly by building, testing, and reading existing code carefully.

Thank you for considering my application. I would welcome the opportunity to discuss how my Python backend, database, API, and research-software background could contribute to TEHORA's development team.

Sincerely,

Amir Mirzai Golpayegani
