

September 2, 2026

Dear Hiring Team,

I am writing to apply for the Remote GIS Developer position with DataVoice, a division of Harris Computer. With a Master of Science in Computer Science from the University of Calgary and hands-on experience building C++ and Python systems for geospatial data processing, storage, retrieval, and visualization, I am excited by the opportunity to contribute to GIS capabilities that support reliable utility operations.

This role is especially interesting to me because it sits exactly at the intersection of software engineering and geospatial systems. The posting's focus on enhancing GIS functionality for an Outage Management System, managing map services and data publishing workflows, and supporting accurate visualization of utility networks feels closely connected to the kind of work I have enjoyed most: turning complex spatial data into systems that people can query, inspect, and trust.

My graduate research focused on scalable management of Earth observation and geospatial data. I built C++ and Python software for processing, storing, and retrieving satellite-imagery datasets, including automated preprocessing workflows with GDAL, Rasterio, SNAP, and satellite data APIs. I also designed a DGGS-based framework that converted imagery into structured tensor datasets, reduced storage requirements by 38% on a Canada-wide dataset, and improved processing performance through multithreaded implementation. This work gave me practical experience with spatial data formats, coordinate-aware workflows, performance tradeoffs, validation, and the challenges of making geospatial information usable at scale.

I also bring backend and database experience that would help me contribute in a product engineering environment. As a back-end developer, I built Django REST APIs backed by PostgreSQL and implemented production-facing logic for authentication, service plans, and payment records. As a teaching assistant in database systems, big data applications, and data-at-scale workflows, I supported students with SQL, cloud storage, data pipelines, debugging, and technical design decisions. These experiences align well with the role's need for GIS development, SQL and spatial database work, GitHub/Jira collaboration, troubleshooting, and clear documentation.

While I have not worked professionally with every tool listed in the posting, such as Leaflet, MapLibre, or enterprise utility data models, I have a strong geospatial software foundation and a record of learning new technical systems quickly. I would be eager to bring my C++/Python, GIS, data-pipeline, and research software experience to DataVoice while deepening my understanding of utility network data and production mapping platforms.

Thank you for considering my application. I would welcome the opportunity to discuss how my geospatial software development and data systems background can contribute to Harris Computer and DataVoice's utility software products.

Sincerely,  
Amir Mirzai Golpayegani
