HiredBuddy

Dear Hiring Team,

I am writing to apply for the Python Developer position with HiredBuddy. I recently completed my M.Sc. in Computer Science at the University of Calgary, and I am interested in this role because it is centered on practical Python development: building APIs, working with databases, debugging issues, writing maintainable code, and contributing to remote software projects with clear documentation.

My professional backend experience comes from Asr Gooyesh Pardaz, where I developed Django REST APIs backed by PostgreSQL for NLP, text-to-speech, and speech-to-text products. I worked on registration, Google login, password reset, email and phone verification, payment-service integration, and relational records for service plans and transactions. That experience gave me hands-on practice building backend features around real user workflows, reasoning about API behavior, and keeping database-backed systems understandable and maintainable.

During my M.Sc., I also built larger Python and C++ research software systems for geospatial and Earth observation data. I developed pipelines for data collection, preprocessing, storage, retrieval, validation, and analysis, including a DGGS-based framework for managing large spatiotemporal satellite datasets. This work required Git-based iteration, reproducible workflows, careful debugging, performance awareness, and clear documentation of technical decisions through a thesis and first-author publication.

I also bring strong communication and mentoring experience from teaching assistant roles at the University of Calgary and Neuromatch Academy. I supported students in database systems, data-at-scale, big-data applications, and deep learning, helping them debug code, understand SQL and data pipelines, and move projects from unclear problems to working implementations. Those roles strengthened the same habits I value in development work: clarity, patience, careful reasoning, and learning quickly.

My strongest fit for this position is in Python, Django, REST APIs, PostgreSQL, SQL, Git, Linux, data workflows, debugging, and technical documentation. I also have working familiarity with Docker, AWS, JavaScript, PyTorch, and AI workflow automation. Although my most recent work has included machine learning and geospatial research, the foundation has been software engineering in Python: designing data flows, writing reliable code, and making technical systems easier to use and maintain.

Thank you for considering my application. I would welcome the opportunity to discuss how my Python backend, database, API, and research-software background could contribute to HiredBuddy's development team.

Sincerely,

Amir Mirzai Golpayegani
